

Pirate Noir

Art Style Guide

Asset Measurements

UI: Made with the idea that screen size is 1920x1080

Buttons should be rectangles with an aspect ratio of 200x100px

Polygon Count: The poly count for the game should be no more than 10,000 tris, with only really the boat model reaching that number. For props such as barrels, boxes, etc reaching between 700-1500 tris.

2D Assets:

Stop Watch: 225x225px

Health Bar Icons: 70x100px

Coin Icons: 70x70px

Textures: 512x512 aspect ratio

File formats

Models: Use FBX files for models

Textures: We'll be using PNG files for the textures and all other 2d assets

Perspective and camera angle.

We will be using a first person camera for this game, with the FOV set to 95 (subject to change)

Lighting, colors, shading.

The lighting will be an off white color, hex code is #f7ffff. This will help mimic moon light. The shades are as follows:

Avoid using #000000, only use #181919 for the darkest of spaces where the light won't touch. #f7ffff and #181919 are the two main colors of the game.

For the gold color, use #FFDF33. Against a dark background it is eye catching and will be noticeable for the player. Here are the shades for the gold color:

Use the upper 3 colors mostly, please.

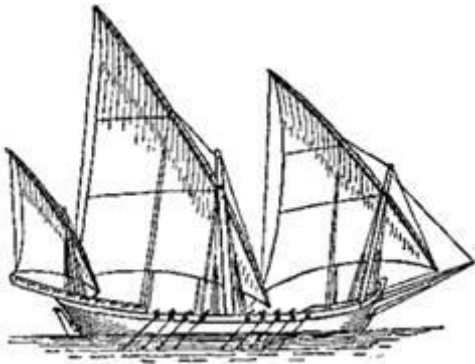

Use #FF3030 for any red that you use. This will help signify danger to the player in an effective way. These are the shades for this color:

[illegible]

Modular ship designs, loosely based off of

Xebec sailing ship:

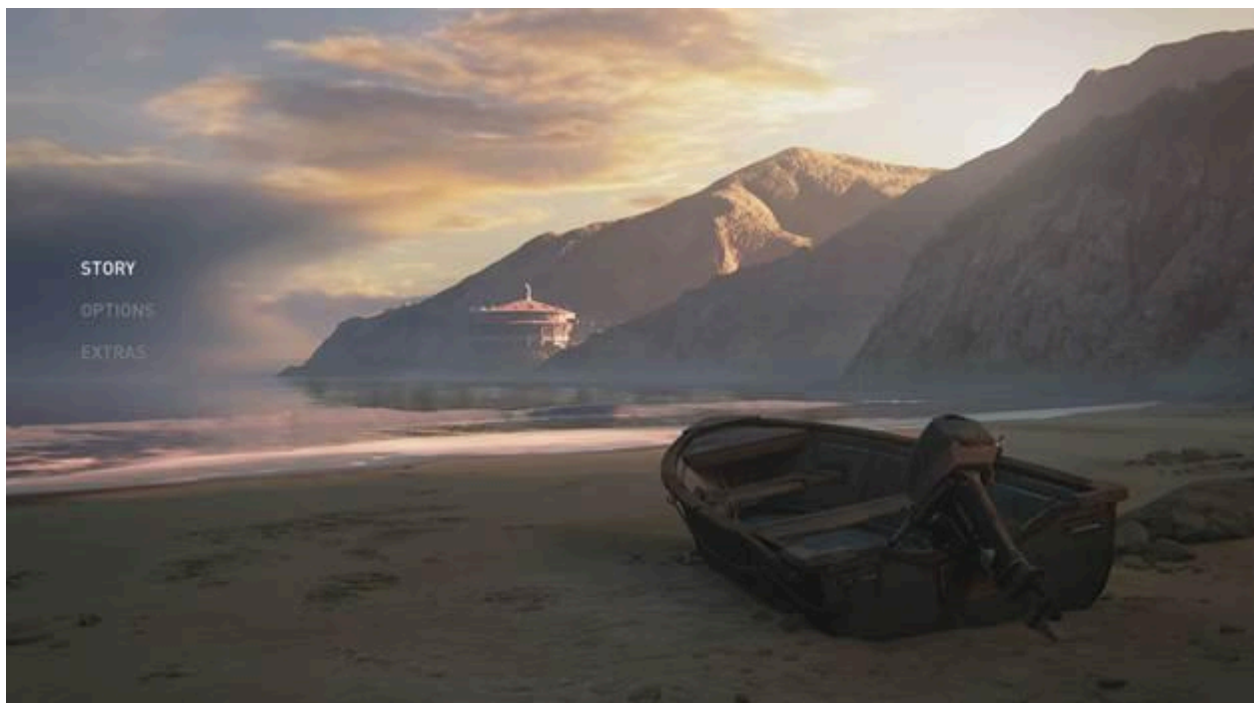

Full Rigged ship:

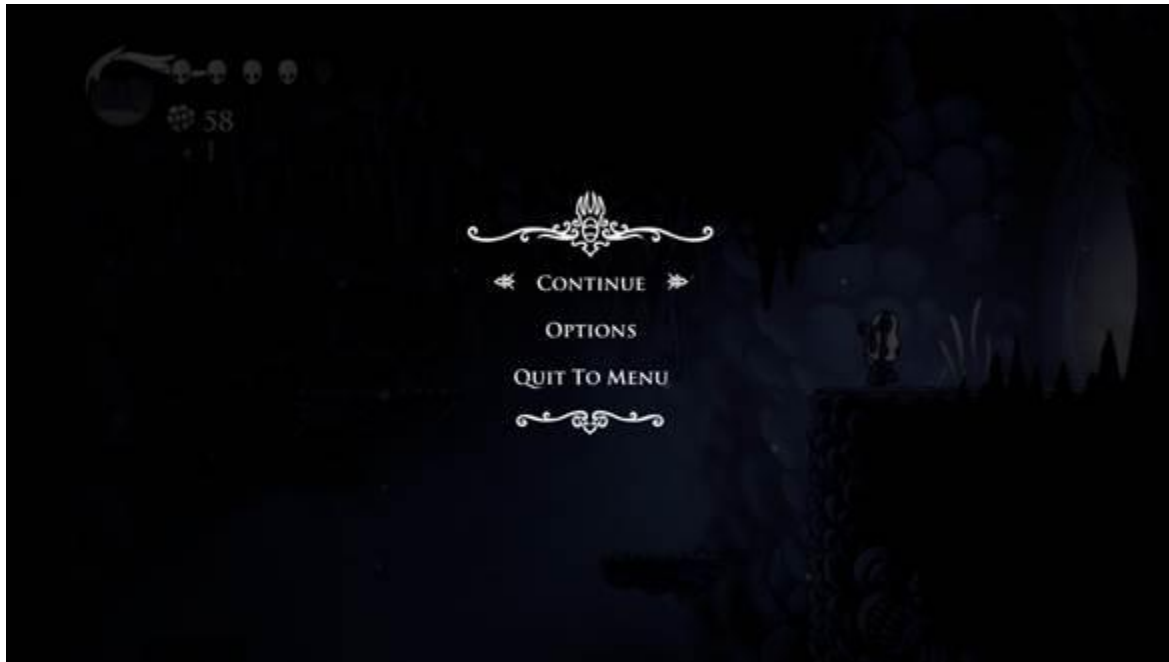

UI design concepts.

Start Screen:

I would like this in almost a sketch book style, something that'll match the dithering shader that will be put onto the game

Pause screen:

I would like to incorporate this icon that Lays made for the design doc

Color theory

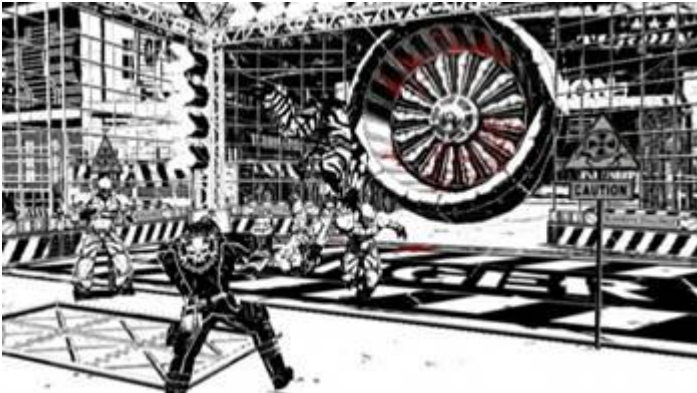

_Use minimal color, really using black, off whites and greys for the actual environment and characters. Only use color to help signify danger (red) and treasure (yellow) to the player. Using these colors will help draw the player's attention to any known threats and signify to them what is an object of interest.

Following are examples of games that use this method to communicate to the player:

Yellow is used here in God Of War to tell the player when to parry

Red is used here in Mad World to indicate to the player that the fan is dangerous/ can be used to take out enemies

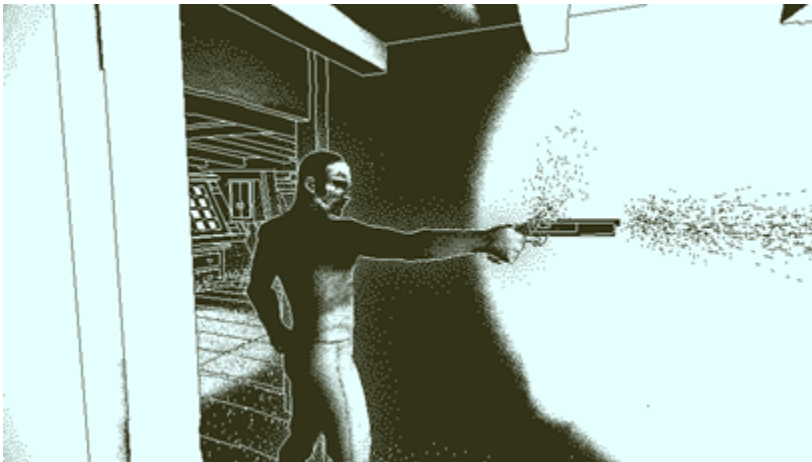

Character shapes

Main character is more of a square shaped, signifying that he's strong and capable

Enemies are to be made with a more triangular shape language, to help sell they are more dangerous

Shader

This game will be using a dithering shader to help give the game an almost sketch book feel. This style is like Stippling, main difference is that Dithering is algorithmic. The main inspiration for this is Return of The Obra Dinn. Below is an example of how that game looks:
