ID: 5380775

Summer 2026

Independent Study

- Gameplay Programming
- May-July 2026
- Working on implementing mechanics related to the player and their interactions throughout the environment
- Working on unique Enemy AI that interacts with the player and the environment.

Development Pieces

In this project, I will be learning how to work with a team in a more independent scenario where I am not in the lead role. This will allow me to take the time to hone my skills better without stressing over managing each part.

Character Controller & Unique interactions

I will be implementing unique character controls, and setting up custom interactions with character movement in mind.

Moving Environment

Setting up the ship to move side to side and cause the player to move with it, as well as affecting the props within the scene.

Camera Movement

Implementing 3D camera movement for the player to allow for dynamic and impactful movement while limiting motion sickness. Working with cinematography in mind to create camera cinematics and designing cutscene that tell environmental storytelling.

Enemy AI

Setting up a custom enemy AI that moves with the moving environment and aggressive AI, while also allowing the player to grab them with their weapon and throw them around.

Objective

This project means a lot to me because I will be refining my skills, creating a portfolio piece that I can be proud of, and working on a game concept that I really enjoy.

Motivation

I am motivated to work on this project because I want to tackle more complex code that interacts with many different aspects of the game. Another reason is that the idea of the game sounded fun to work on with my friends.
